One of the most feared Canon printer errors is B200, which can indicate a potentially catastrophic error with the device. Dont junk it immediately, though. Printers are expensive, and there are a few methods you can try to fix the error before you shop for a new printer. A print head is a part that distributes the ink from the cartridges onto the paper, meaning its one of the most important aspects of the entire printer. Print heads are known to be problematic, especially on cheaper printers.

Try some of the below suggestions before you replace the entire device. A good, long reset allows the printer to cool down and restore everything to its proper position before turning the device back on. There's a possibility something is disrupting the connection to the printer head. Open the printers door and carefully disconnect the print head, then lift it out of the device. Reseat it and see if that fixes the issue. Press the lever to remove the printer head. Use the devices maintenance options to run its cleaning cycle. This is especially useful if the printer head is clogged. Use either pure alcohol or a nonoilbased cleaner on the print heads gold contacts. Use a microfiber cloth to rub the cleaner onto the contacts, then let it dry completely before reconnecting. Run it under hot tap water until the water comes out clean. Dab it dry with a paper towel, then reinsert the head into the printer. Find your device on the official Canon support page and follow the directions for updating the drivers. Faulty cartridges rarely trigger the B200 error, but it can happen. Refer to the user manual for this process regarding your specific device. Its time to shop for a new printer. Before you go trashing the printer or buying a new one try some of the following suggestions. 1. Remove all ink cartridges and re install new ones. 2. Remove Print Head and thoroughly clean all of the gold contacts on the print head itself. When re installing the print head make sure that the ribbon cable connector is firmly plugged in to the print head itself this usually applies to older models. 3. When the print head is out thoroughly clean it by flushing all ink out under the hot water tap. This video may help Print head Cleaning 4. Next method to try is to reload the printers drivers as the B200 error code can be caused in some cases by a corrupted Driver. 5. Try turning the printer off and unplugging it at the wall for at least 2 hours. Sometimes this can work. 6.

If all else fails please follow the instructions on this video. 7. Purchase a new Print Head from canon and install it yourself. this is not recommended as it is usually not much more expensive to buy a new printer. The image to the left indicates the cleaning of the contacts on the print head itself. These need to be cleaned thoroughly with either pure alcohol or a non oily cleaning fluid. If these contacts are dirty it can cause the B200 error to occur. When cleaning the print head be very careful as the bottom of the print head is very delicate and will not tolerate rough treatment. This picture shows the actual part of the print head were the ink is sprayed from. between his thumb and fore finger. The next picture to the left indicates the correct method to clean a print head. Simply hold it under a hot water tap and keep the water flowing through until the water comes out fully clean. This will remove any hardened ink which has solidified inside of the print head itself. The print head can be dried after by using a hair drier or simply by carefully dabbing it with a lint free cloth or paper towel. Canon B200 Error video Fix If you would like a more in depth look at how to fix the B200 error then take a look at the following video. Just go with the subtitles ! On some occasions we have certainly managed to revive printers using the above methods however the percentage of successes are small. My background is in electronics so I kinda know the effect that constant temperature variations have on any electronic piece of equipment. The thermal printhead used in Canon printers uses a myriad of small resistors which are constantly heating up to spit the ink out and then turning off and cooling down again. After a couple of years of this often the minute resistors inside the head simply die or open circuit. Once this occurs then you end up with one of the dreaded B200, U052, U054 etc error messages.

<http://cleananddecluttered.com/images/buell-xb-user-manual.pdf>

Honestly folks if you get one of these dont spend hours trying to fix it, quickly try the above solutions and if they dont remove the error message then grab it by the 240 cord and launch it out the door. What about replacing the printhead. Many folks get attached to their printer and even when its near death they simply dont want to part with it. Many are not tech savvy and they have spent several years simply working out how to use the thing. Finally they get the hang of printing when the dreaded printhead error occurs and devastates them. Many older folks dont care how much its gonna cost to fix or replace the printhead and even if they gotta mortgage their house to them it seems a better alternative than to have to purchase some new fandango printer and spend another couple of years learning to operate the thing. Seriously folks the best alternative is to simply update to a new Canon printer as they are not so much different to use than your current printer. Instillation is very simple and even though you may be apprehensive once you take the plunge you will soon master the operation of the new printer. Replacing the printhead should not even be a consideration. They are expensive, hard to obtain and even if you do repair the printer chances are that a 2 year old or more printer will simply develop another problem before too long. Often either

the plastic drive gear will chew out, the ink waste pad will fill up or some other part of the printer will die. The support code Error B200 is one of the most common errors encountered in the Canon Printers. The troubleshooting for resolving this error is quite simple. The cartridge cradle will automatically lift up. Remove all the cartridges from the cradle. 2. Next step is to remove the printhead which can be easily done by lifting the lever which is located just beside the cartridge cradle. After you have lifted the lever, then just gently remove the printhead from the printer. 3.

<http://cleanteclogistics.com/images/buell-ulysses-workshop-manual.pdf>

In the third step, reinsert the printhead back into its position in the printer and make sure to lock the lever. 4. Then reinsert all the cartridges into their correct positions in the printer and make sure that there is no open door. By ensuring the closure of doors assures that the printer is ready with the access to the cartridges and printhead. 5. Then physically unplug your printer cord from the electricity board and leave it unplugged for at least 5 or more minutes. This results in cooling down of the printer and the lingering electrical energy is also eliminated. 6. Replug the printer. 7. The final step is to start a cleaning cycle or perform an extensive nozzle check. The Error B200 normally doesn't happen when the printer has a regular access to the printhead. Troubleshooting 2 Cartridge Canon Printers 1. Turn OFF the printer. The cartridge cradle actually gets stuck in the Error B200 state. However, retuning the printer temporarily let us further rectify the Error B200. 2. Turn the printer ON again. 3. The Error B200 does not exactly indicate the problematic cartridge. Therefore, you should have a rough idea that which cartridge you replaced last. Remove that cartridge gently from the slot. 4. In a 2 cartridge Canon printer, the printer's printhead is the part of the cartridge. This printer has a limitation that you cannot prevent the Error B200 without replacing the problematic cartridge. Therefore replace the cartridge with an old functioning cartridge or replace it with a new one. 5. Do an extensive nozzle check or a cleaning cycle. After the replacement of the cartridge, this is a critical step to determine whether the desired cartridge is replaced from the printer. 6. If the problem is still unresolved, then replace the other cartridge with a new one or an old functioning cartridge. As this Canon printer works with 2 cartridges, so it is obvious that either of the two cartridges is faulty.

Replacing and checking both cartridges one by one should resolve the problem. 7. If the problem still persists after performing all the above steps for troubleshooting both types of Canon printers, then it is recommended to the user to get in touch with the Canon Helpline or a printer technician.
