## css safe manual 2016, css safe manual.

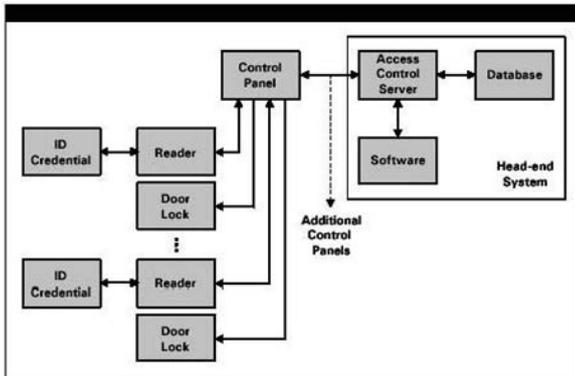

If this does not work please contact us via the live chat feature on the home page of the website or call our Customer Service team at 8002421055 The serial number is behind the wall so I have to open up the wall to get at it, but the old owners said they don't have the combo but it's empty. How do I get it open to reprogram it. I have no receipt, and the safe is the touch button style. Help I would like to use it. Sorry we can't help. How do i know which lock i do have Thanks They will be able to help you figure this out! Thanks The lock just beeps and will not take codes. We changed batteries. It still beeps There are a few different ways to contact them Live chat which can be found on the website, calling them at 8002421055, or filling out this form Thank you! Thanks 8002421055 Had to change battery and now code does not work. It beeps twice telling me that I have the right code but will not open. If the battery is not all alkaline there may not be enough power to open the locking mechanism. If this does not work please contact us via live chat on the website or by calling 8002421055 Thank you I am concerned with the electronic lock, I am afraid I will lock and it will fail and I will not be able to get in to the safe. What do you do in this situation. I like the safe but with no key override if it fails your stuck! Electronic locks provide faster access in the case of an emergency and the fail rate is actually extremely rare and unlikely. As long as you keep up to date with changing your battery you shouldn't have an issue. For batteries we recommend an all alkaline Duracell or Energizer battery with an expiration date of 5 years in the future. If however your electronic lock does fail your Cannon warranty covers you on parts for the lifetime of the safe and for one year on locksmiths and labor. We hope this can help ease your mind!<http://www.analyticgroup.ru/userfiles/hotpoint-wd61-manual.xml>

To make a long story short my wife called downstairs for dinner, I closed the door and decided to change my code after dinner and load my contents. After dinner guess what!!! The default code would not work. I have tried all I could to reopen with no success. The nearest Locksmith is at least 50 miles away and quoted me far more than I no the safe is worth 16 Gun Safe. I cannot locate manufacturer anywhere on line or any info on how I can open this horror. Please advise, any help would be appreciated. However our Customer Service team believes that it could potentially be a StackOn model. Cannon recently acquired StackOn so our team is reaching out to their Customer Service Department to verify whether or not it is their product. If it is, we will reach out to you via email. Otherwise, I would suggest calling the store you purchased the safe from and asking them. The store managers or associates typically know simple instructions for the safes they sell. Thanks! Is there a way for us to reset the combination so that it is usable again without knowing the combination Thanks! If I change the battery with safe door closed and locked will my code be lost It is stored in the locks memory not the actual keypad. Please let us know if you need further assistance. I have a problem, I do not remember my password from the safe. What should I do, how can I open it Please call our customer service department and we will see if we can assist you! Thanks. Here at Liberty Safe, we strive to provide the quality products and services youre looking for. Have any questions Feel free to contact us online or via phone and talk to our experienced customer service team. Theyll be happy to help. Here's What To Do To be fair, it was a rather stressful time, and I was not as securityminded as I am now, so don't silently judge me, oh faithful reader. Safes are important security tools that have many unique uses, and they give their users an all around enhanced sense of security. Like I said, I've been there and it's hard to get through on your own. Luckily enough for you, I will help you figure out what to do after you forgot a safe combination and you happen to be locked out of your safe. It goes without saying that it is a safe that uses some type of combination to permit entry, but this does not mean that you have narrowed down which type of safe it is. Due to the fact that there is a wide spectrum of items that people want to keep safe, there are different types of security safes to protect your valuables. These range from electronic safes to gun safes, and they can store anything from jewelry to the symbol of your second amendment rights I'm talking about guns. Properly identifying your safe means that you will be able to use the appropriate measures to reset your code, recover it, or unlock your safe. The last thing you want to do is panic and use a wrong access method for your safe. That ends up damaging the safe and all of its internal components.

If you think this could never happen to you, you should probably talk to someone who has been in a lockout scenario before. How exactly will they be able to help you. The same idea applies to your safe. In order to get help, you have to request help for a specific safe. This holds true regardless of whether you contact the manufacturer or the locksmith. You will have to provide some basic information about the safe in order for them to know which course of action they should take. The serial number can either be found on the side of the safe as is the case for most Sentry safes or it can be found on the back panel of the safe. For security purposes, not all safes have their serial numbers inscribed or plastered on the body of the safe. So don't fret if you cannot find your serial number, simply use information from the purchase order to find out the brand and type of safe you have. Now let's continue with what you have to do after you say "I forgot my safe combination". Key overrides come in handy because they allow you to gain access to your safe through the use of an alternative method. This works well for emergency situations or situations where you might have to give a secondary party access to your safe. It helps to think of them as spare keys, except they're for your safe and not your house. The key override is also extremely useful for instances where you have forgotten the combination to your safe. Lots of people neglect to read the user manual when they buy something, so it is not unheard of. Also, not all safes advertise the fact that they have an

override key. This is often done to ensure that people do not have easy access to the keyway. If there is an easy access path to the keyway, it increases the chances of someone potentially overriding the safety mechanisms of the safe, either by drilling or picking the lock. Doing so will save you time, and it will help you get back into your safe in an expedient manner.

[www.cndasion.com/d/files/cash-machine-instruction-manual.pdf](http://www.cndasion.com/d/files/cash-machine-instruction-manual.pdf)

However, if you find yourself saying "I forgot my safe combination", do not get your hopes up about the mechanical override key. Due to the potential for it to be a liability, not all safe manufacturers utilize one in their safes. You will eventually make your way back into your safe. There are many people who have said, "I forgot the combination to my safe," who have ended up gaining access to their safes once again. In the absence of a mechanical override key, a change key can be used to help you out of your predicament. A change key allows you to change the combination that grants access to your safe. This is extremely useful for when you have forgotten your combination. Also, you might be required to input your old combination when you are using a change key, which will be very difficult to accomplish if you forgot safe combination. For this safe, you can insert the change key in the back of the safe and then you have to input the reset combination. This set of numbers is merely a way of wiping the slate clean for you to set a new code to your safe. However, I am speaking from experience when I say that people rarely have these elements on hand, so you will likely have to resort to calling a locksmith to help you get back into your safe. A locksmith will be able to help you gain entry into a safe you are locked out of. It is important to walk yourself through the above solutions before you make the decision to call a locksmith. It is possible that you have an override key or a change key. So when you forget the combination to your safe, make sure you run through all the possible scenarios before you reach out to ask for help. Safes are very intricate devices, and if they are not treated properly, you could potentially damage your security investment and the contents of your safe as well. Ideally, you want to find a locksmith that is familiar with safes, and one that seems knowledgeable about your particular safe.

In order for a locksmith to help you in the best way possible, you have to give them enough information about your safe so that they are not walking into the job blind. Ideally, you should provide the locksmith with the brand and model of the safe, because this allows them to familiarize themselves with the safe as well as pick out the necessary tools for the job. This means that if you have forgotten the combination to your electronic safe, the locksmith should not walk in thinking that you have forgotten the combination to a mechanical safe. Providing the locksmith with the adequate information will ensure that they can help you out in the best way possible. Let's take a quick way at some of the methods a locksmith can use to gain entry to your safe. Also, when most people think about safe manipulation, they conjure up an image of a debonair spy a la James Bond who wears a charming smile and can open any safe in under 2 minutes. Safe manipulation is a lot more intricate and trickier than that. It requires skill and patience that only the best locksmiths possess. The reason why this is a popular entry method is because it allows a locksmith to gain entry without damaging any of the components. There are some other entry methods that can be taken advantage of, but these run the risk of damaging the internal mechanisms of your safe. In order to properly manipulate a safe, you have to be somewhat knowledgeable in the way the wheel pack and spindle of the safe dial work. It is unlikely that the locksmith will have to resort to using a forced entry method on your safe since it is not broken. In most cases where forced entry used, there has been some internal or external damage to the safe, which has rendered it nearly impossible to open by other means. Drilling can be done in different ways to achieve different results.

For instance, you can opt to choose right through the wheel pack and render the locking mechanism ineffective, or you can drill a hole that allows you to insert a fiber optic cable. Once the cable is inserted, the locksmith will be able to see the way the wheels in the wheel pack move in accordance to the dial. This will make it relatively easy for them to align the wheels and open the

safe. Even if the second drilling method is used, you now have a hole that gives criminals and burglars unfettered access to the internal workings of your safe. It can be challenging if you find yourself saying, "I forgot my safe combination," but if you keep a level head, you will be able to navigate the situation and gain access to your safe once again. Always remember, that forced entry into your safe should always be your last resort, especially if you plan to continue to use the safe. Here Are 10 Things I Did To Get Back In.
